Smart Wallet System

Midterm Seatwork #2 – Smart Wallet System

Create a Java program that simulates a digital wallet system with transaction tracking.

Source Code:

*SmartWalletSystemAlidro.java

```java
package mypackage;
import java.util.Scanner;

public class SmartWalletSystemAlidro {

    public static void main(String[] args) {
        Scanner input = new Scanner(System.in);
        int balance = 5000, transaction = 1, choice, count = 1;

        do {
            System.out.println("===== SMART WALLET MENU =====");
            System.out.println("1. View Balance\r\n"
                    + "2. Cash In\r\n"
                    + "3. Send Money\r\n"
                    + "4. Exit");
            System.out.println("Transaction " + count++);
            System.out.println("Choice: ");
            choice = input.nextInt();

            switch (choice) {
                case 1:     //View Balance
                    System.out.println("Balance: " + balance);
                    transaction += 1;
                    break;
                case 2:     //Cash in
                    System.out.println("Cash In: ");
                    balance += input.nextInt();
                    System.out.println("New Balance: " + balance);
                    transaction += 1;
                    break;
                case 3:     //Send Money
                    System.out.println("Send Money: ");
                    int smoney = input.nextInt();
                    if (smoney < 100) {
                        System.out.println("Minimum of 100. Try again.");
                    } else if (smoney > 1500) {
                        System.out.println("Exceeds maximum limit");
                    } else if (smoney > balance) {
```

*SmartWalletSystemAlidro.java

```java
            choice = input.nextInt();

            switch (choice) {
                case 1:     //View Balance
                    System.out.println("Balance: " + balance);
                    transaction += 1;
                    break;
                case 2:     //Cash in
                    System.out.println("Cash In: ");
                    balance += input.nextInt();
                    System.out.println("New Balance: " + balance);
                    transaction += 1;
                    break;
                case 3:     //Send Money
                    System.out.println("Send Money: ");
                    int smoney = input.nextInt();
                    if (smoney < 100) {
                        System.out.println("Minimum of 100. Try again.");
                    } else if (smoney > 1500) {
                        System.out.println("Exceeds maximum limit");
                    } else if (smoney > balance) {
                        System.out.println("Insufficient Balance");
                    } else {
                        System.out.println("Sent successfully!");
                        balance -= smoney;
                        System.out.println("New Balance: " + balance);
                        transaction += 1;
                    }
                    break;
                case 4:     //Exit and Total successful transactions
                    System.out.println("Exiting.....\nTotal transactions: " + transaction);
                    break;
                default:
                    System.out.println("Invalid Input. Try again.");
            }
        } while (choice != 4);
        input.close();
    }
}
```

Output:

```
===== SMART WALLET MENU =====
1. View Balance
2. Cash In
3. Send Money
4. Exit
Transaction 1
Choice:
1
Balance: 5000
===== SMART WALLET MENU =====
1. View Balance
2. Cash In
3. Send Money
4. Exit
Transaction 2
Choice:
2
Cash In:
3000
New Balance: 8000
===== SMART WALLET MENU =====
1. View Balance
2. Cash In
3. Send Money
4. Exit
Transaction 3
Choice:
3
Send Money:
50
Minimum of 100. Try again.
===== SMART WALLET MENU =====
1. View Balance
2. Cash In
3. Send Money
4. Exit
Transaction 4
```

```
Transaction 4
Choice:
3
Send Money:
1500
Sent successfully!
New Balance: 6500
===== SMART WALLET MENU =====
1. View Balance
2. Cash In
3. Send Money
4. Exit
Transaction 5
Choice:
4
Exiting.....
Total transactions: 4
```

Short Explanation:

- **While loop:** It keeps repeating the menu as long as the exit option is not chosen (choice != 4).
- **Switch-case:** It runs a specific block of code based on the user's menu choice.
- **If-else:** It checks conditions (like limits and balance) to allow or reject a transaction.

DAPSL JAY S. ALIDRO BSIT 2-3 3/25/20 Smart Wallet system

```
package mypackage
import java.util.scanner

public class smartwalletsystemAlidro {
